

specifications

agg-lime is a crushed and screened natural limestone. It is intended for use in reducing soil acidity.

Neutralising Value (dry basis)	80%
Calcium	31%
Magnesium	<1%
Calcium Carbonate	77%
Magnesium Carbonate	2%
Moisture - typical	10%
Particle Size >1mm	10%

warning

the dust from this product may irritate the eyes and skin - avoid contact and inhalation of dust.

Improve Farm productivity.

Pastures and crops thrive when soil has the correct pH balance and the required nutrients. The application of agricultural lime assists in balancing the soil pH in acid soils, soil fertility is increased and nutrients such as phosphorus are made available to plants.

As a soft limestone agg-lime gets straight to work, with improvements reported within 12 months of application, and ongoing improvements in subsequent years.

Studies* have shown that soft limestone can be surface applied without the need to be incorporated into the soil. Users have commented that the overall particle size distribution of agg-lime assists in spreading. Regular testing is undertaken to ensure that agg-lime conforms to specifications.

Balances soil pH
Improves soil fertility
Reacts quickly so that you reap the benefits sooner
Ideal particle sizing for spreading
Consistent quality

* Regional site report no. 2 "The impact of surface applied soft lime to soil conditions and pasture production in Western Victoria, 2002"

* Specification revised May 2012
